Ohjelmistokehityksen matematiikka 3 op

Our app **GlugoMate** is a utility application for diabetics and healthcare professionals for monitoring carbohydrate intake.

On **Home Screen** we display the daily carb intake per day, organized by meals in a pie chart.

We used react native chart kit for the pie chart. For better clarification we used different colors for each meal.

Beneath the chart we added a summary of the consumed, targeted and remaining carbs of the day.

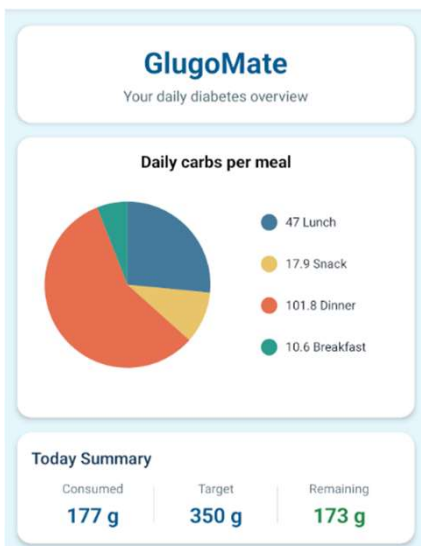

FIGURE 1. Home Screen - Pie chart and Today's summary

Food Diary presents a variety of different charts.

In this section we have a horizontal progress bar, Daily Carb Target, to show the daily carbs intake compared to the actual daily carb intake recommendation in color (green, yellow, red).

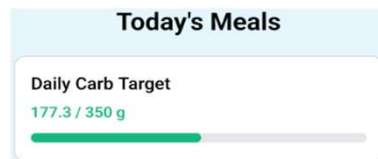

Figure 2: Food Diary - Daily Carb Target

Additionally we have a line chart with a trendline to illustrate the daily carb intake (green line) and weekly trend (orange line).

The 'Carbs per Meal' chart shows the summary of carbs per meal type in a bar chart. Molemmat chart types were done using react native chart kit.

In **Food Search** we have a pie chart summarizing a product's nutrition information (carbs, protein, fat).

This chart was done using React Native Scalable Vector Graphics library.
